# Part 1

## Course organization

# Organization of the course

6 weeks of classes:

- 15h of lectures – presence recommended
- 15h of laboratories (5x3h every week) – **presence obligatory**

Please check carefully the locations and hours every week.

Platform course: <https://platforma.polsl.pl/roz/course/view.php?id=1406>

Password: PfCS1\_ct\_2024

Rules are at the Platform.

# Laboratory classes

- Attendance at the laboratory is required. Students have to attend all laboratory classes.
- Students are obligated to come on time to the laboratory classes and be prepared within the scope of the lecture.
- During the laboratory classes, students work individually.
- At the beginning of each laboratory classes, there will be the initial test to check the student's preparation for the classes. Each test will be graded from 0% to 100%. The test will be based on the material covered during previous lectures and laboratories.
- The final grade from the laboratory will be established as an average from all laboratory test grades.
- To pass the laboratory part, a student needs to achieve the final laboratory grade of 40% or higher.

# Laboratory classes

- Excuses for absences are made only on the basis of a sick leave document provided by the medical doctor. In other justified cases, excuses are considered on an individual basis.
- After a sick leave, the student must make up the initial test for which he/she was absent within one week of the date of the missed laboratories or of his/her recovery.
- Any changes to the course schedule proposed by students will be discussed solely with the group leader.
- Students are required to enroll to "Programming for Cognitive Science" course at Remote Education Platform (PZE).
- Students are required to regularly check their student mail and information provided through the Remote Education Platform (PZE). Any information and announcements posted in this PZE course will be treated as having reached the students.

# Test and final grade

- The test will be conducted during the last lecture.
- The test will be graded from 0% – 100%. To pass the test student needs to obtain a grade of 40% or higher.
- At first,  $Fg$  will be calculated using the following formula:

$$F_g = 0.5 \text{ } Test_{grade} + 0.5 \text{ } Lab_{grade}$$

where:

$Test_{grade}$  - the grade from the final test.

$Lab_{grade}$  - laboratory grade calculated as an average grade.

# Course plan

- 1) Basics of R.
- 2) Graphics and visualization.
- 3) R for data analysis.
- 4) Text-mining.
- 5) Documentation of reproducibility.
- 6) R reports and web applications.
- 7) Helpful programming tools.

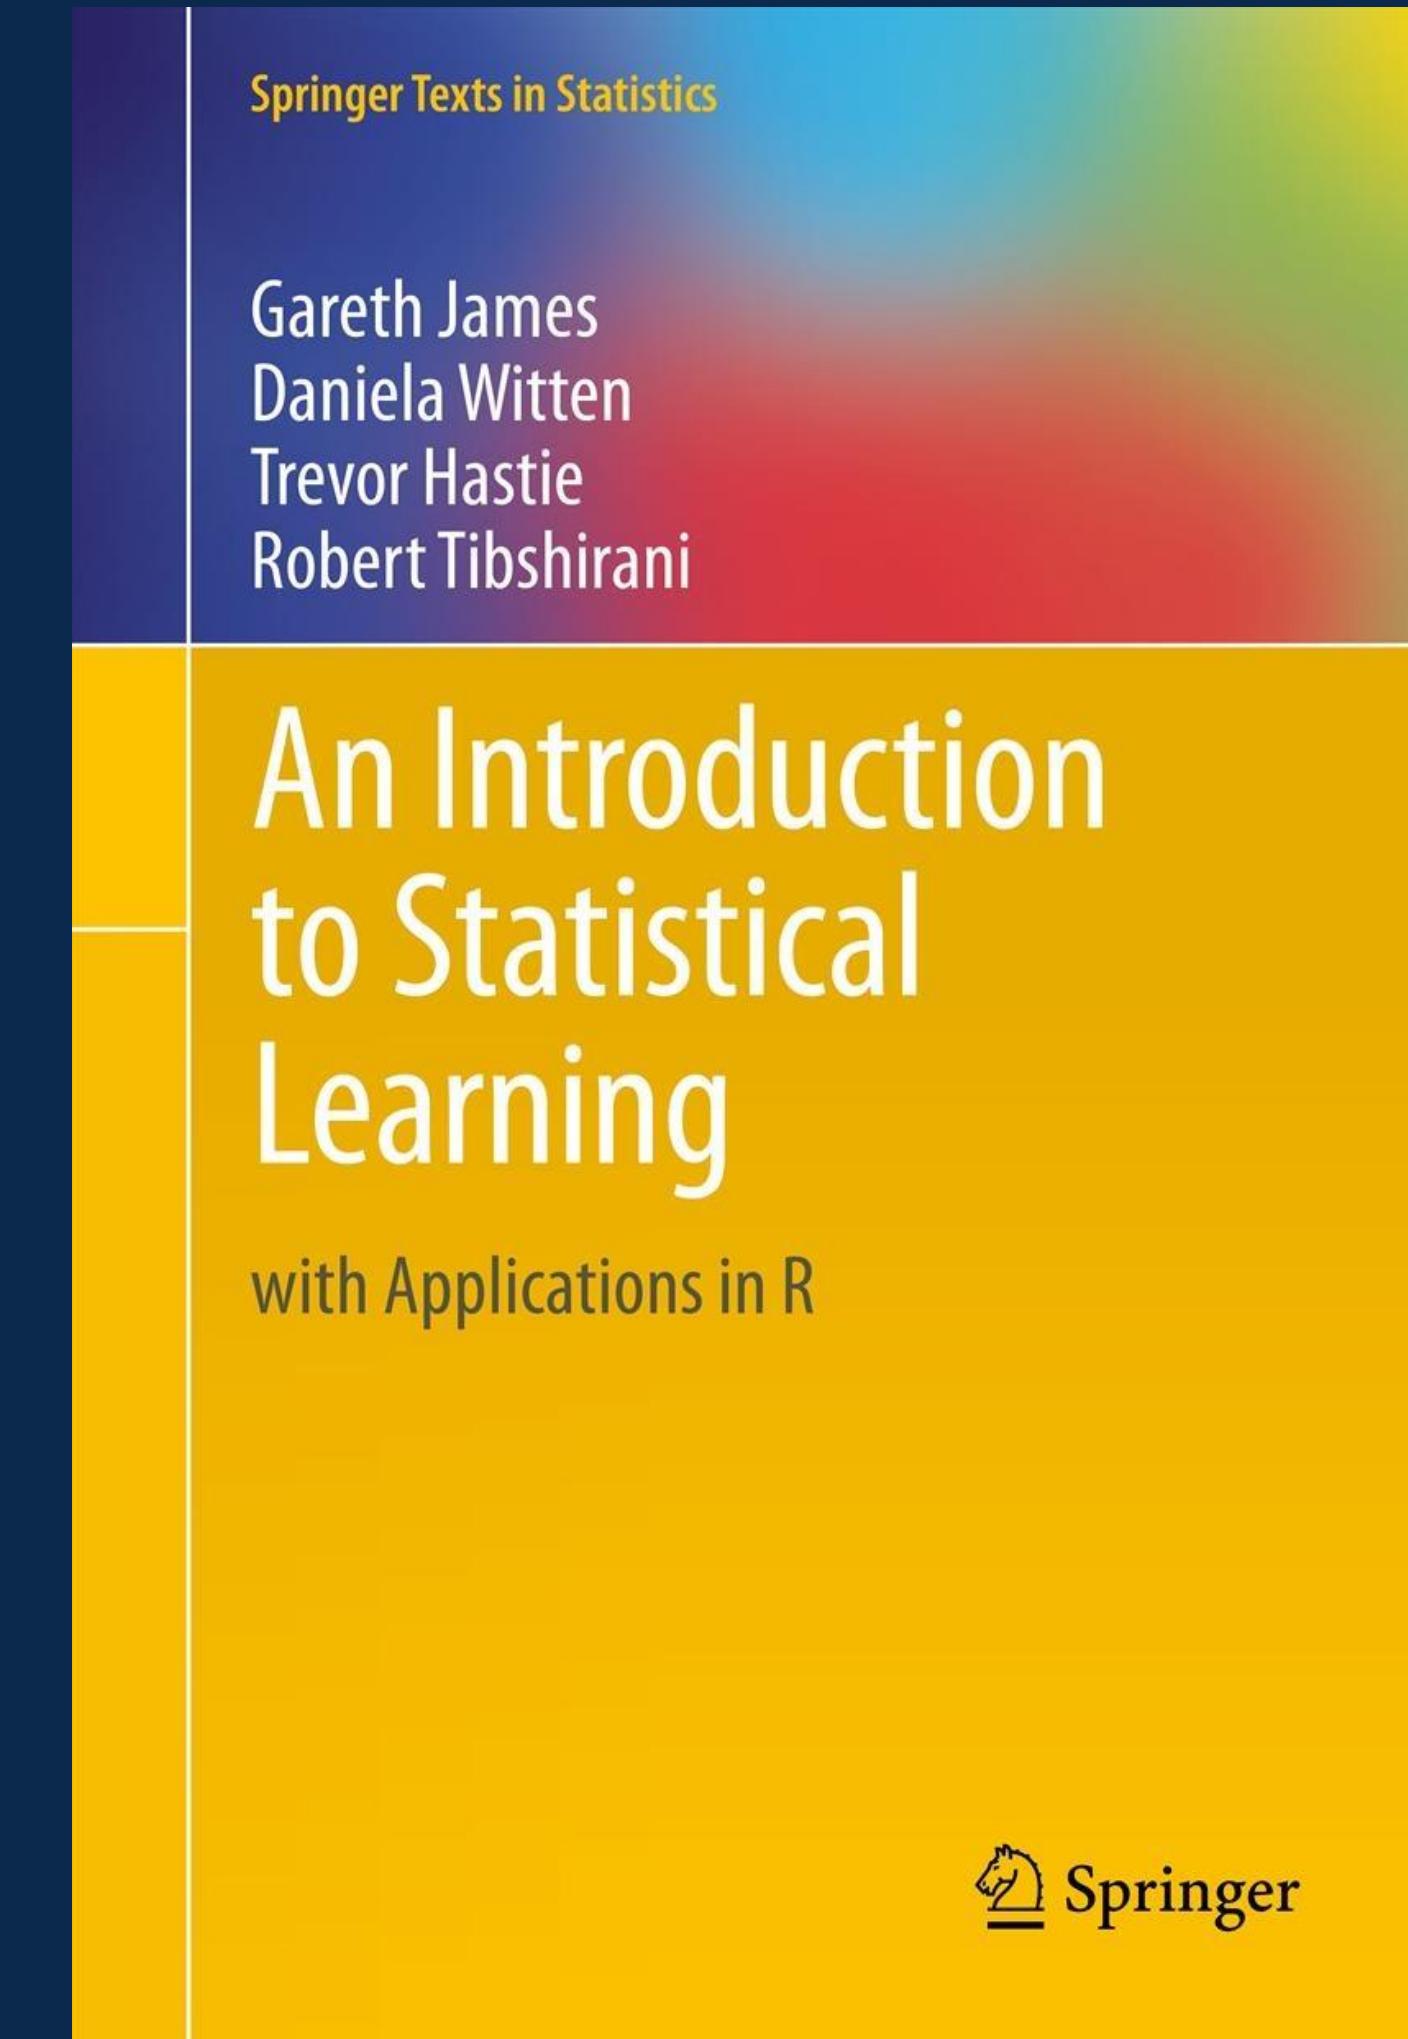

# Schedule

Date	Lecture	Laboratory
12.11.2024	Lecture 1	
19.11.2024	Lecture 2	Laboratory 1: R basics
26.11.2024	Lecture 3	Laboratory 2: R basics, data visualization
03.12.2024	Lecture 4	Laboratory 3: Data analysis in R
10.12.2024	Lecture 5	Laboratory 4: Text-mining
17.12.2024	TEST + Lecture 6	Laboratory 5: Rmarkdown and Shiny

DataCamp – website with online courses on coding, data analysis, and AI.

[datacamp.com](https://www.datacamp.com)

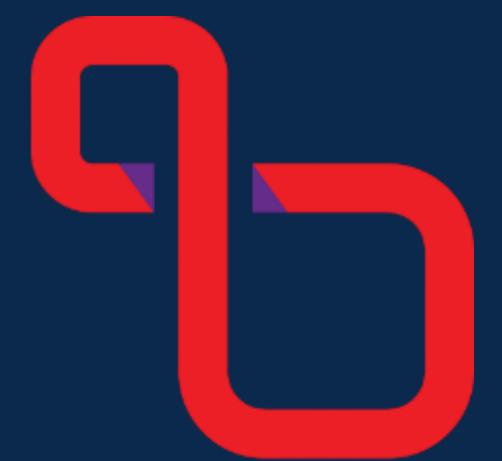

Free access for our students.  
Contact to Joanna Żyła, PhD  
(joanna.zyla@polsl.pl).

The screenshot shows the DataCamp website's course search interface. At the top, there's a header with the DataCamp logo and a search bar containing 'datacamp.com'. Below the header, a section titled 'Courses' with a 'Hands-on learning' badge is displayed. A sub-section below it states: 'It's time to roll up your sleeves—we learn best by doing. All of our courses are interactive, combining short videos with hands-on exercises.' To the right of this text is a circular 'LEARN' icon with four nodes and arrows. Below the main header, there are two rows of course filters: 'All', 'Python', 'SQL', 'R', 'Power BI', 'Tableau', 'Alteryx', 'Excel', 'Google Sheets', 'ChatGPT', 'PyTorch', 'OpenAI', 'AWS', 'Azure', 'Snowflake' in the first row, and 'Databricks', 'Git', 'Docker', 'Shell', 'Kubernetes', 'Airflow', 'Spark', 'Dbt', '+13' in the second row. On the left side of the main content area, there's a '121 Courses' count. On the right, there are three course cards:

- Introduction to R** (Beginner): Master the basics of data analysis in R, including vectors, lists, and data frames, and practice R with real data sets. Taught by Jonathan Cornelissen (Co-founder of DataCamp). Duration: 4h. Start button.
- Introduction to the Tidyverse** (Beginner): Get started on the path to exploring and visualizing your own data with the tidyverse, a powerful and popular collection of data science tools within R. Taught by David Robinson (Principal Data Scientist at Heap). Duration: 4h. Start button.
- Intermediate R** (Beginner): Continue your journey to becoming an R ninja by learning about conditional statements, loops, and vector functions. Taught by Filip Schouwenaars (Data Science Instructor at DataCamp). Duration: 6h. Start button.

# Part 2

## Introduction to programming

# Why are we here?

- Computer programs are ubiquitous.
- The ability to implement your own algorithms is useful in any job.
- Programming makes it easier to find a job (provided you are programming at the right level).
- Fast, easy, and attractive data analysis and visualization.
- Fun! ☺

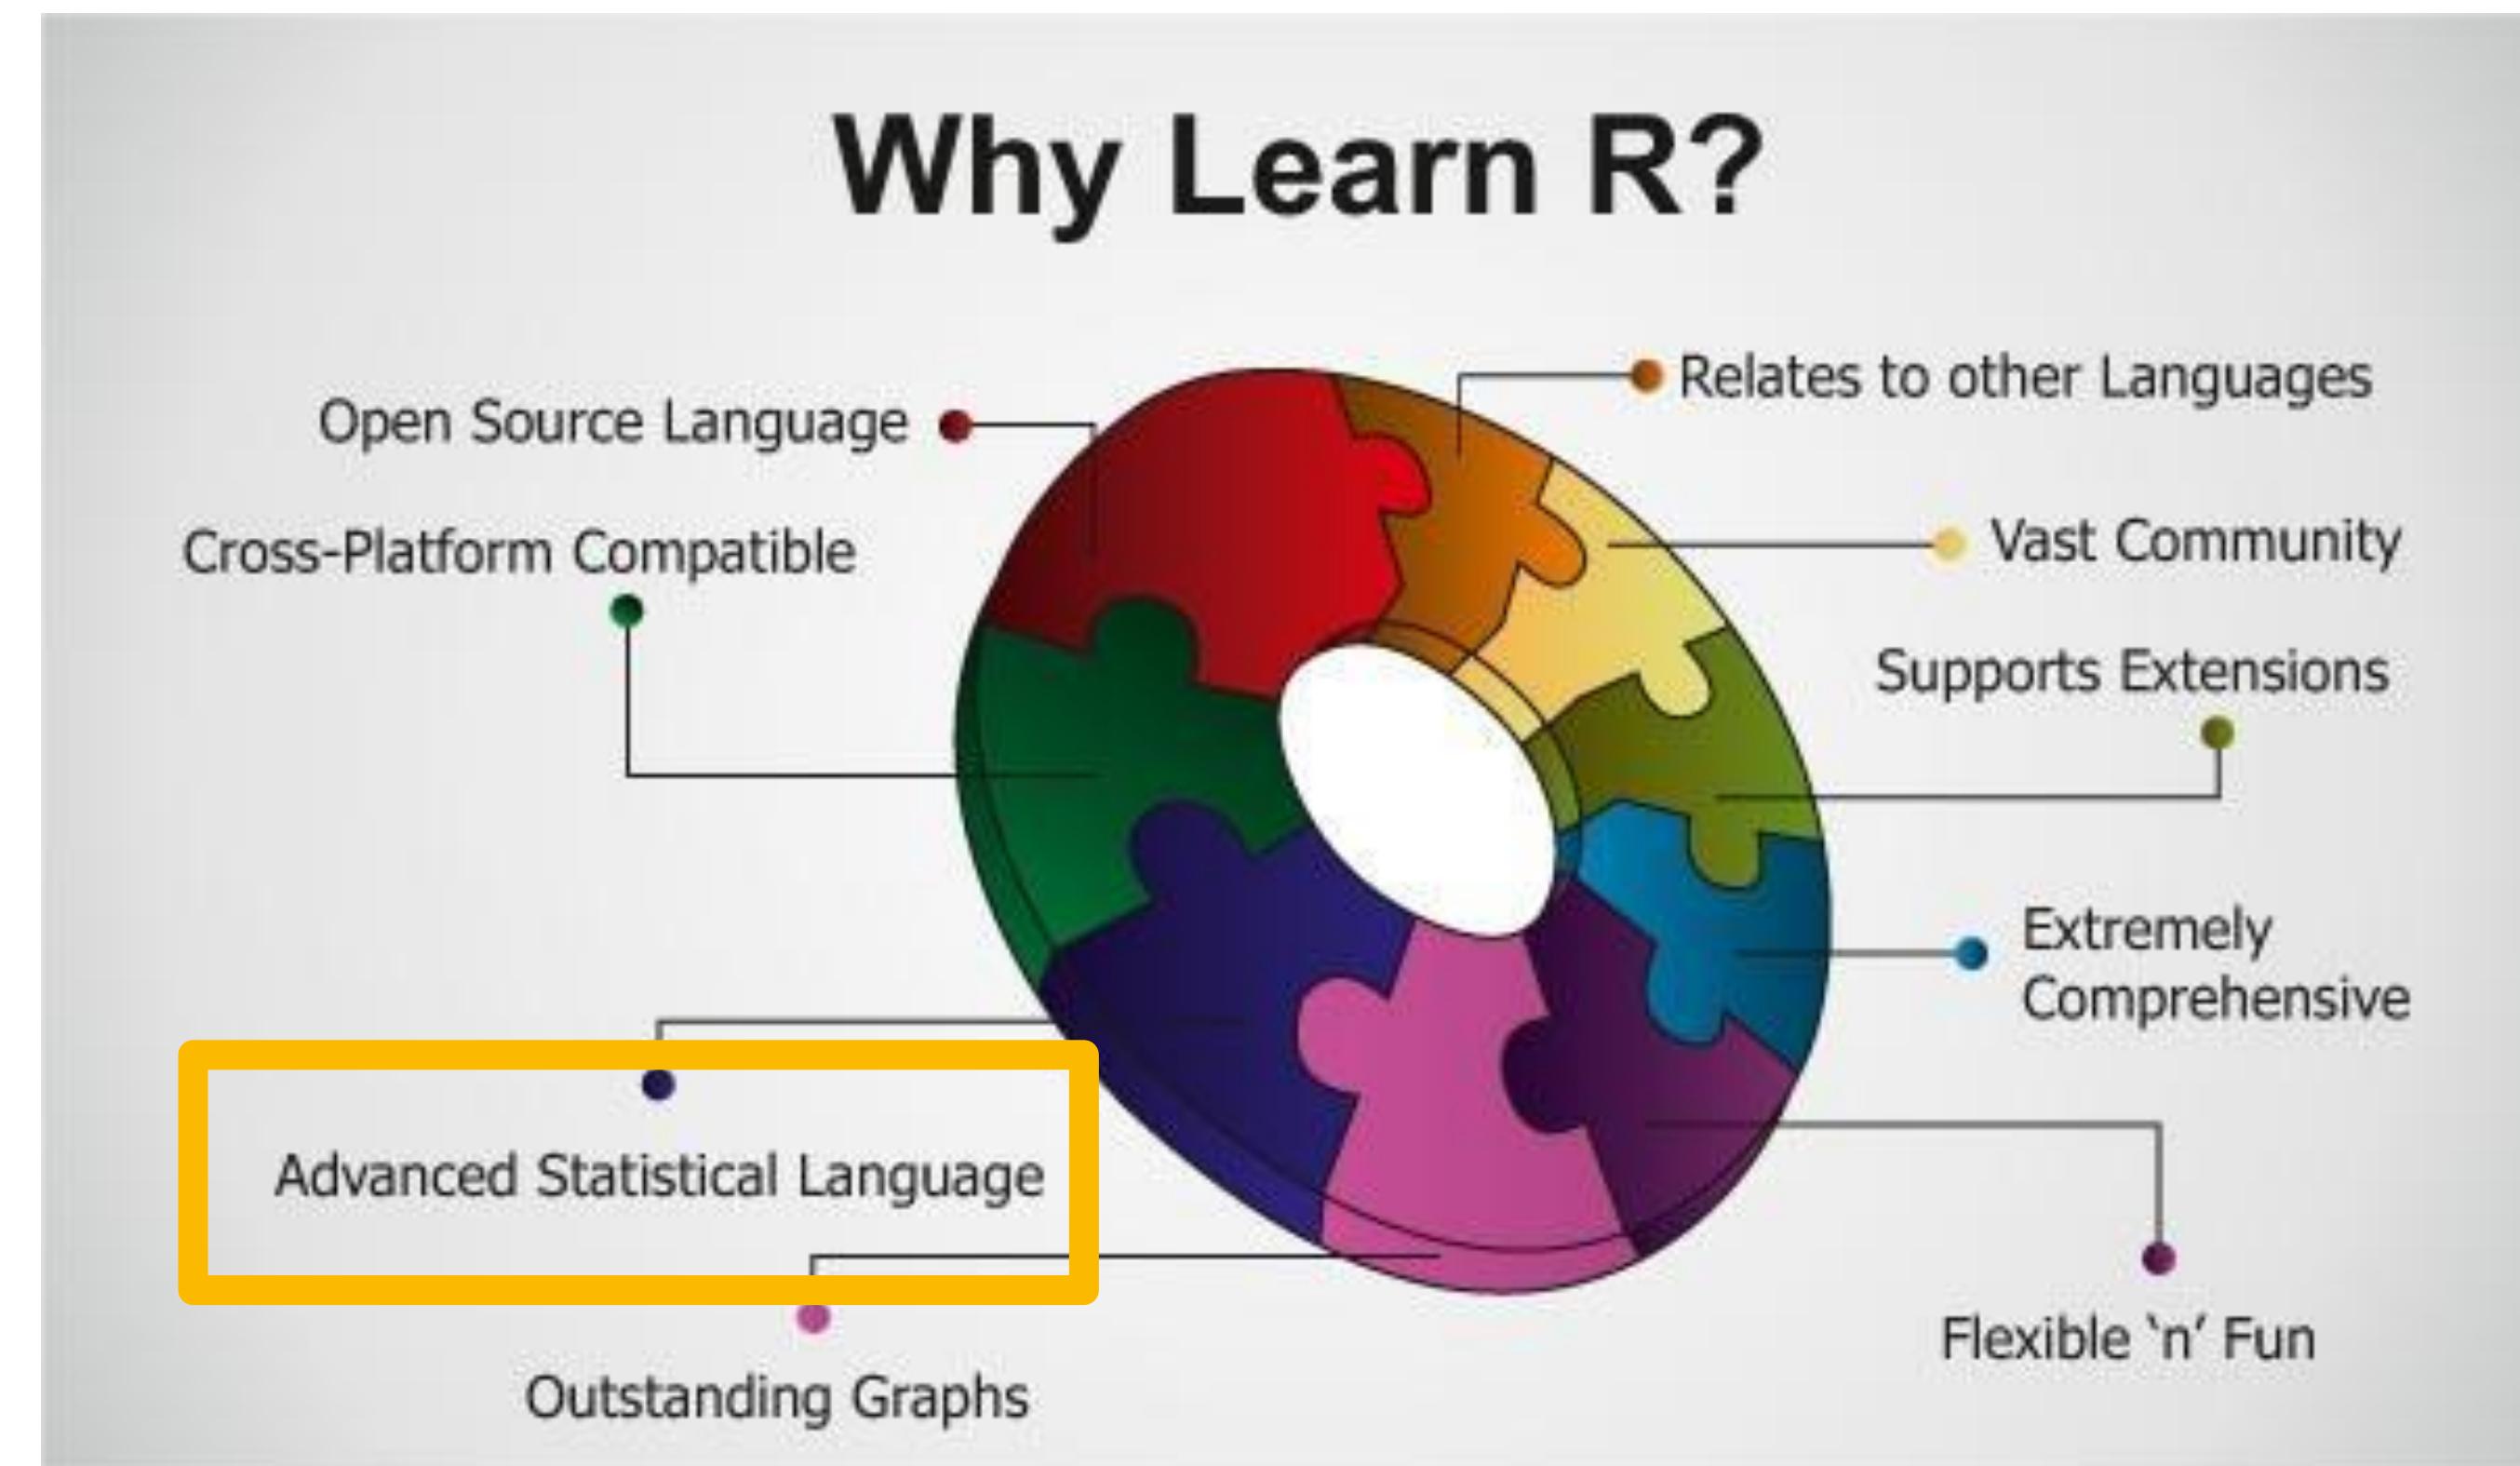

# How to learn programming?

- Learning programming is not learning by heart!
- You need to understand the principles in order to apply them later to write your own programs.
- To learn programming, you must start programming.
- Reading 100 books on programming will not give practical skills.

# Why are we here?

Source: <https://blogs.umass.edu/gwis/2015/05/21/crash-course-in-r-programming/>

# — Why R?

One of the greatest advantages of R:  
getting your work done better and in less  
time.

Frank Harrell

Member of R foundation, Professor of Biostatistics, Vanderbilt University

# — Why R?

- Intuitive and compact syntax.
- Automatic memory management.
- Support of many platforms.
- Wide range of libraries and packages.
- Open-source licence.
- Other reasons you'll have to discover yourself ☺

# A little bit of history

- Language for statistical computing.
- Particularly suited for math and data analysis.
- Successor of S language – language created in 1976 for an interactive data analysis.
- Named after creators (Ross Ihaka and Robert Gentleman – R&R), from the Faculty of Statistics of Auckland University.
- They initially created its first version in 1991 for students as a statistics teaching aid.

# Interpreted/script language

- Interpreter translates and executes code line by line → we can run each part of the code separately and view the results.
- Different interpreters for various hardware and OS.
- Same program for various hardware and OS.
- Other interpreted/script languages: Python, Perl, Ruby, MATLAB.

# How to start?

✓ Interpreter

✓ Development environment (e.g., RStudio)

□ Third-party packages

And over 10,000 more...

# The R Project for Statistical Computing

[Home]

Download

CRAN

R Project

## Getting Started

R is a free software environment for statistical computing and graphics. It compiles and runs on a wide variety of UNIX platforms, Windows and MacOS. To [download R](#), please choose your preferred [CRAN mirror](#).

If you have questions about R like how to download and install the software, or what the license terms are, please read our [answers to frequently asked questions](#) before you send an email.

## The Comprehensive R Archive Network

### Download and Install R

Precompiled binary distributions of the base system and contributed packages, **Windows and Mac** users most likely want one of these versions of R:

- [Download R for Linux \(Debian, Fedora/Redhat, Ubuntu\)](#)
- [Download R for macOS](#)
- [Download R for Windows](#)

R is part of many Linux distributions, you should check with your Linux package management system in addition to the link above.

## 2: Install RStudio

[DOWNLOAD RSTUDIO DESKTOP FOR WINDOWS](#)

Size: 263.71 MB | [SHA-256: 2C3CF96A](#) | Version: 2024.09.1+394 |

Released: 2024-11-04

Silesian University  
of Technology

# RStudio

The screenshot shows the RStudio interface with several callout boxes providing information about its features:

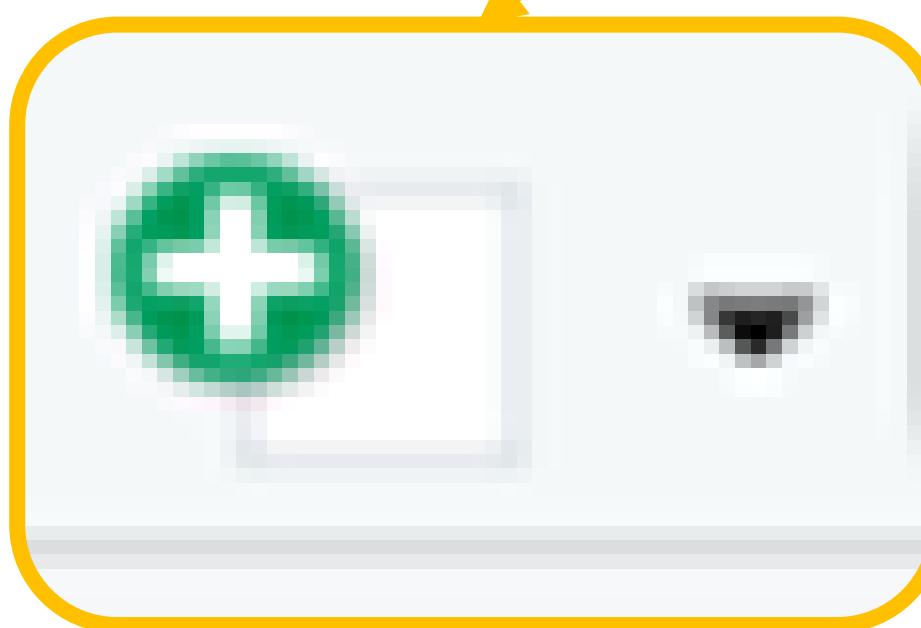

- Editor:** You'll write your program here.
- Environment:** Here the list of objects you create will appear.
- Plots:** You will find them under this tab.
- Console:** Here the commands you use and your results will appear.
- Help:** Write here what information you are looking for.

Silesian University  
of Technology

# RStudio

This button is used to create a new script, i.e. a text file in which the programme is saved.

# RStudio

These buttons  
are used to save  
the results  
of your work.

The screenshot shows the RStudio interface. The top toolbar has several icons highlighted with yellow boxes: a plus sign for creating new files, a disk icon for saving, a double-disk icon for saving with version control, a magnifying glass for search, and a 'Run' button. The code editor displays the R startup message:

```
R version 3.5.2 (2018-12-20) -- "Eggshell Igloo"  
Copyright (c) 2018 The R Foundation for Statistical Computing  
Platform: x86_64-w64-mingw32/x64 (64-bit)  
  
R is free software and comes with ABSOLUTELY NO WARRANTY.

'citation()' on how to cite R or R packages in publications.  
  
Type 'demo()' for some demos, 'help()' for on-line help, or  
'help.start()' for an HTML browser interface to help.  
Type 'q()' to quit R.
```

The environment pane shows 'Environment' tab selected with the message 'Environment is empty'. The global environment pane shows a single entry: 'Global Environment'.

# RStudio

It is used to run the selected part of the script or line where the cursor is located. The shortcut Ctrl+Enter does the same. The run section will be displayed in the console along with the result.

The screenshot shows the RStudio interface. A yellow callout box points from the text in the orange box to the 'Run' button in the top toolbar. The 'Run' button is highlighted with a yellow box. Another yellow box highlights the 'Run' button in the top-left toolbar. The main workspace shows the R startup message:

```
R version 3.5.2 (2018-12-20) -- "Eggshell Igloo"
Copyright (c) 2018 The R Foundation for Statistical Computing
Platform: x86_64-w64-mingw32/x64 (64-bit)

# Part 3

## Basics of R

---

# Scalar variables

A <- 5	numeric
B <- "gene"	character
C <- TRUE	logical

# — Arithmetic operators

Operator	Description
+	addition
-	subtraction
*	multiplication
/	division
$\wedge$ or $**$	exponentiation
$x \% \% y$	modulus ( $x \bmod y$ ) (5% % 2 is 1)
$x \% / \% y$	integer division (5% / % 2 is 2)

# Logical operators

Operator	Description
<	less than
<=	less than or equal to
>	greater than
>=	greater than or equal to
==	exactly equal to
!=	not equal to
!x	not x
x & y	x AND y
x   y	x OR y

Logical values:  
**TRUE**  
**FALSE**

# Vectors

```
a <- c(1, 2, 3, -4, 4.5)
b <- c("gene", "protein", "transcript")
c <- c(TRUE, FALSE, TRUE, TRUE)
```

Let's move on to coding...

# Factors

```
gender <- c(rep("male",20), rep("female", 30))
gender <- factor(gender)

gender
[1] male   male
     male   male   male   male   male   male   male
     male   male   female female female ...
Levels: female male

summary(gender)

female   male
      30      20

levels(gender) <- c("F", "M")

gender
[1] M M M M M M M M M M M M M M M F F F F F F F F F F F F F F F F F F F F F F F F F F
```

# Matrices

```
v <- c(1, 2, 1, 2, 1, 2)
m <- matrix(v, nrow=2, ncol=3, byrow=FALSE)
[,1] [,2] [,3]
[1,] 1     1     1
[2,] 2     2     2
m <- matrix(v, nrow=2, ncol=3, byrow=TRUE)
[,1] [,2] [,3]
[1,] 1     2     1
[2,] 2     1     2
```

# Lists

```
a <- 1:10
y <- matrix(1:6, nrow=2, ncol=3, byrow=FALSE)
l <- list(name="Anne", mynumbers=a, mymatrix=y, age=15.3)

$name
[1] "Anne"
$mynumbers
[1] 1 2 3 4 5 6 7 8 9 10
$mymatrix
 [,1] [,2] [,3]
[1,] 1     3     5
[2,] 2     4     6
$age
[1] 15.3
```

# Data frames

```
id <- c(1, 2, 3, 4)  
name <- c("John", "Anne", "Tom", "Kate")  
status <- c(TRUE, TRUE, FALSE, FALSE)  
d <- data.frame(id, name, status)  
names(d) <- c("ID", "Name", "Status")
```

	ID	Name	Status
1	1	John	TRUE
2	2	Anne	TRUE
3	3	Tom	FALSE
4	4	Kate	FALSE

# Data structures

Data type	create from scratch	Function to: create from other data types	check the data type
Scalar	-	-	-
Vector	<code>c()</code>	<code>c()</code> <code>as.character()</code> <code>as.numeric()</code>	<code>is.character()</code> <code>is.numeric()</code>
Factor	<code>factor()</code>	<code>factor()</code> <code>as.factor()</code>	<code>is.factor()</code>
Matrix	<code>matrix()</code>	<code>as.matrix()</code>	<code>is.matrix()</code>
List	<code>list()</code>	<code>as.list()</code>	<code>is.list()</code>
Data frame	<code>data.frame()</code>	<code>as.data.frame()</code>	<code>is.data.frame()</code>

Let's move on to coding...

# Useful functions

- `class()` - checks the class of an object (e.g. data frame, factor)
- `str()` - shows structure of an object
- `summary()` - prints summary of the object
- `length()` - gives number of elements in a vector/factor/list
- `dim()`, `nrow()`, `ncol()` - give dimensions of data frame/matrix
- `table()` - gives the counts at each combination in matrix/data frame/vector/factor
- `print()` - prints the object in the console
- `head()`/`tail()` - print first/last six elements or rows

# Useful math functions

- `sum()` - returns the sum of values in a vector/matrix
- `rowSums()`/`colSums()` - gives the sum of values in each row/column
- `mean()` - returns the mean of values in a vector/matrix
- `median()` - returns the median of values in a vector/matrix
- `sd()` - returns the standard deviation of values in a vector/matrix
- `sqrt()` - gives a square root of the number

Let's move on to coding...

# — Functions

```
myfunction <- function(arg1, arg2=NULL, ...){
```

*what\_my\_function\_does*

```
  return(object) #kinda optional
```

```
}
```

```
myfunction(x,5)
```

# Packages

Installing packages:

- 1) `install.packages("packageName")`
- 2) `install_github("author/package") #devtools package`
- 3) Install from source (.zip/tar.gz file)

To use an installed package:

```
library(package_name)
```

Silesian University  
of Technology

# Packages

If you get an error looking like:

Error in arrange() : could not find function “function\_name”,

the package is not loaded yet.

Try: library(package\_name)

If the package fails to load, it means it is not installed yet.

# Packages

To use a function from an installed and loaded package:

```
function_name(arg1, arg2, ...)
```

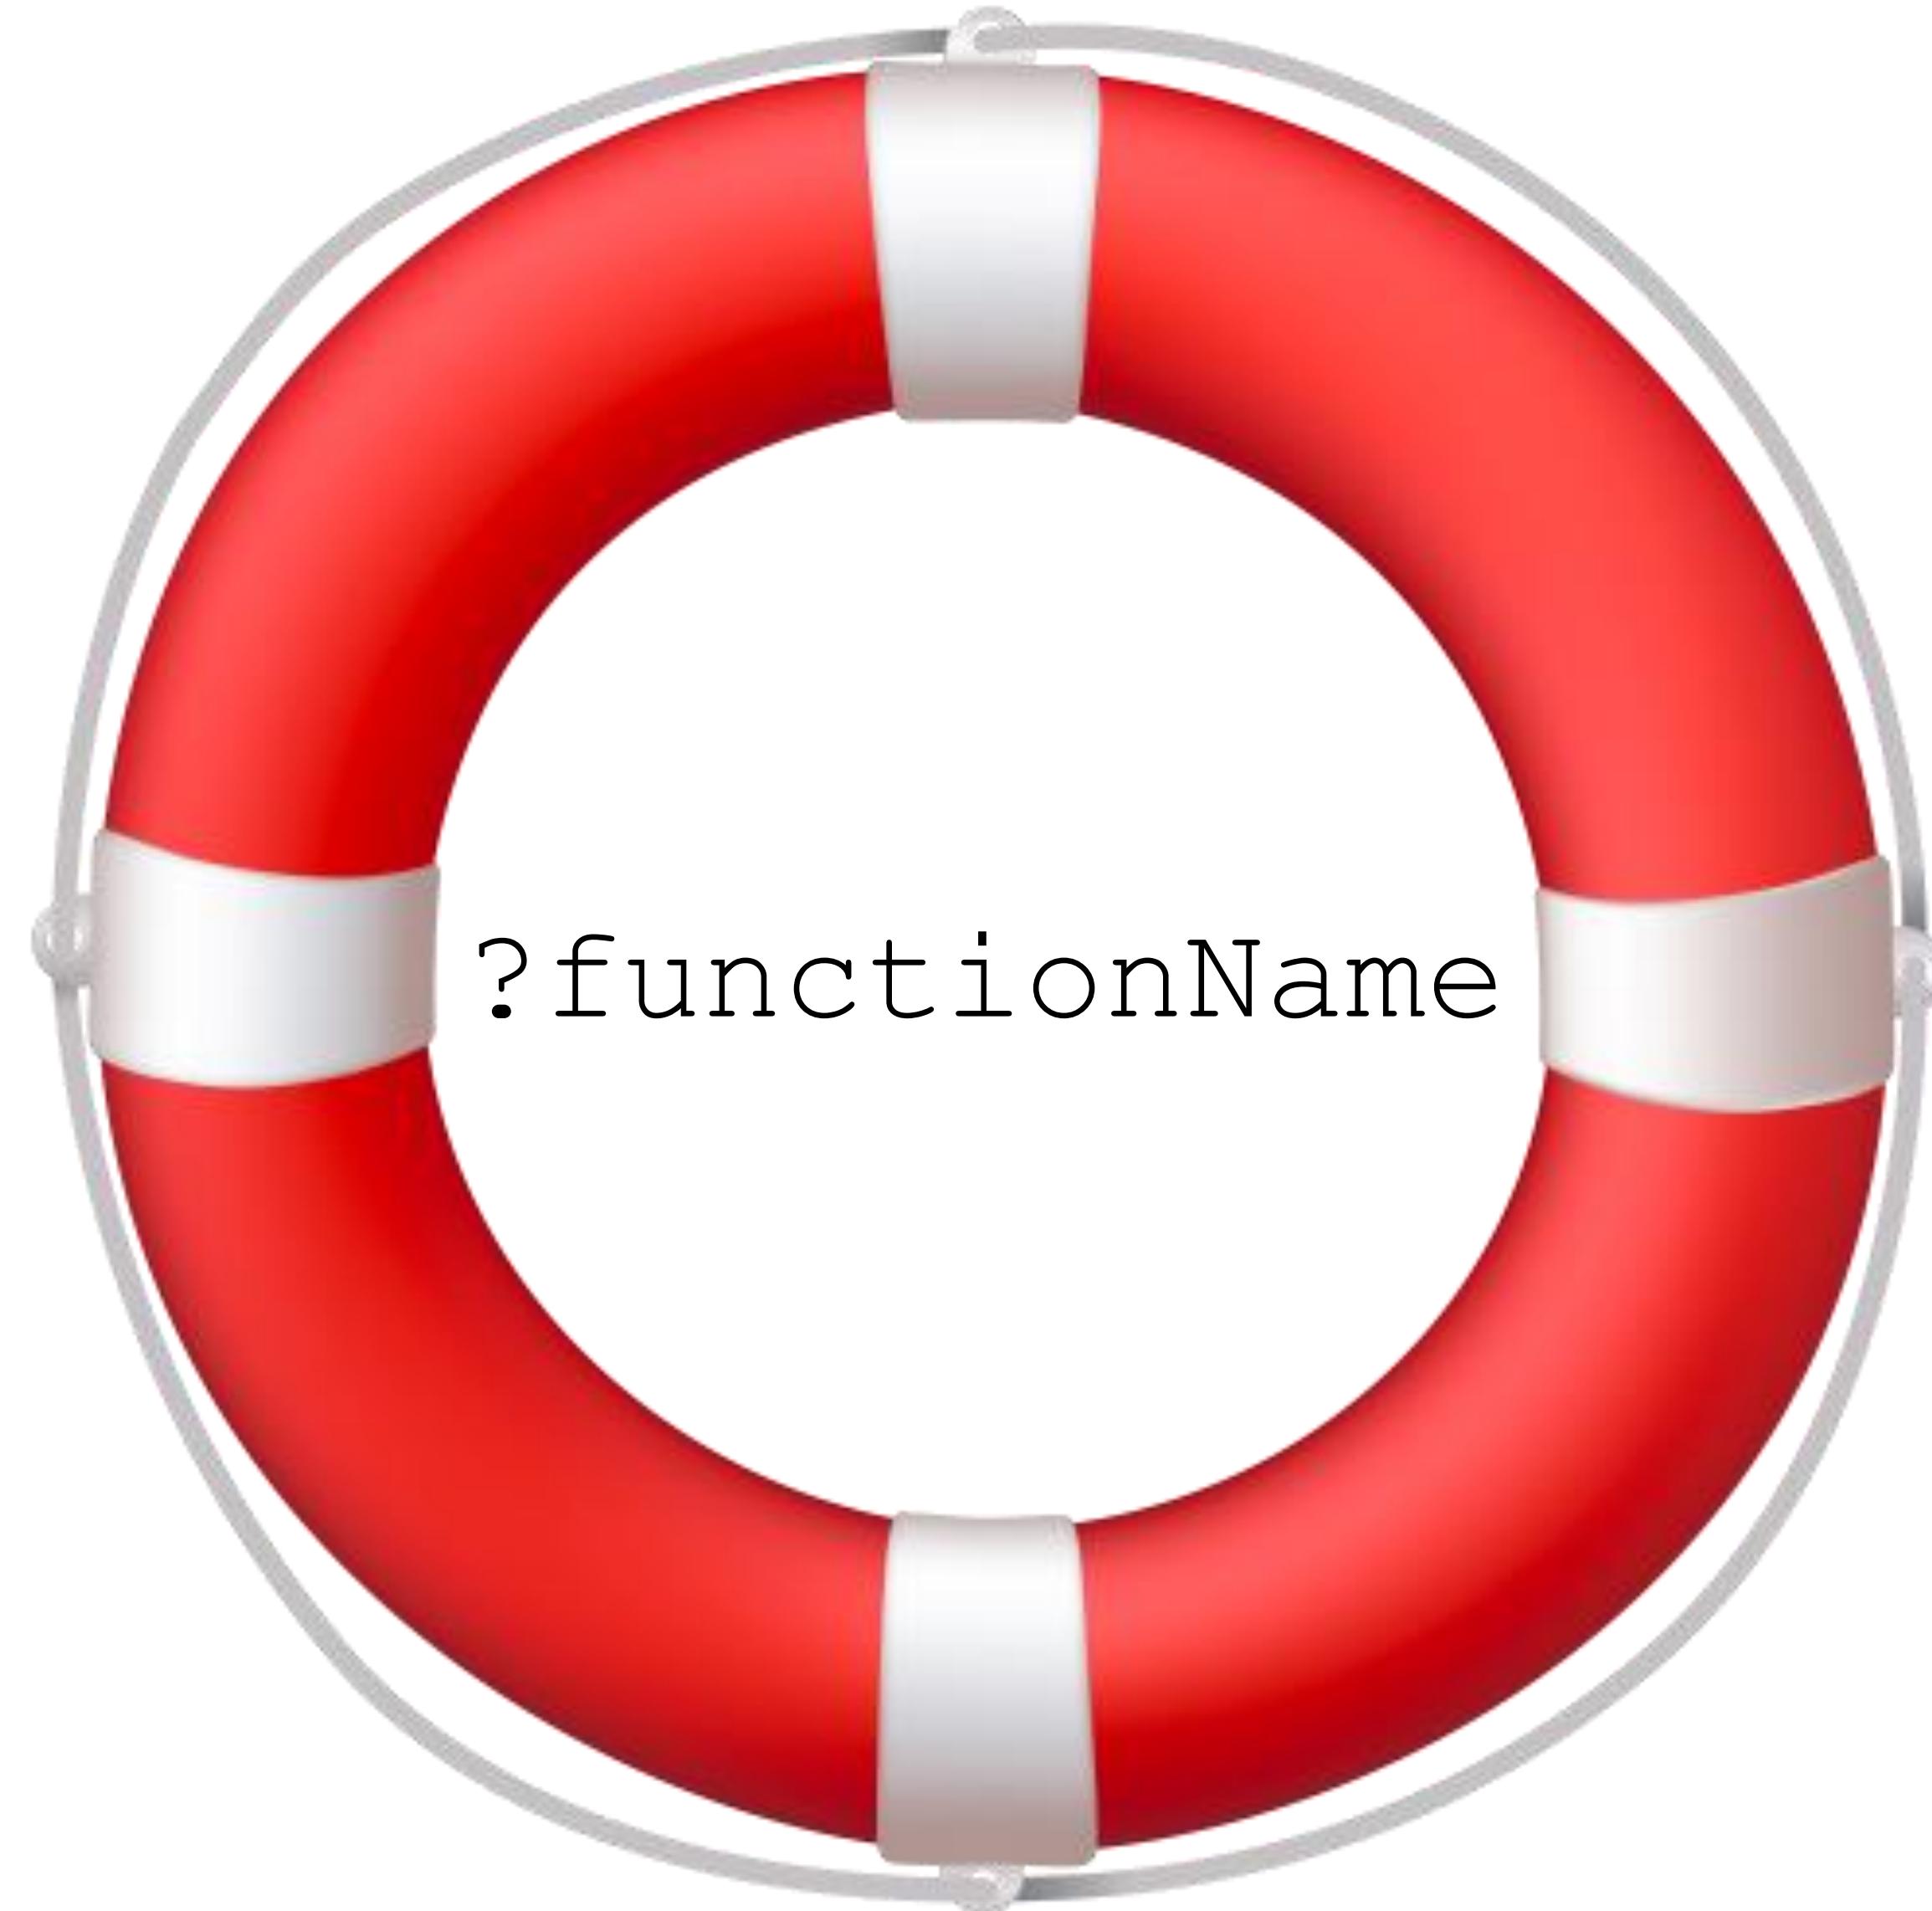

To use a dataset from an installed and loaded package:

```
data("dataset_name")  
attach(dataset_name)
```

# Comments

- Everything after the sign **#** is ignored by the interpreter – it is not executed.
- It can be a description written by the author or a piece of code that should be ignored for now.
- You should write comments for chunks of source code (for another programmer and yourself in some time).

?functionName

Silesian University  
of Technology

RESEARCH  
UNIVERSITY  
EXCELLENCE INITIATIVE

Let's move on to coding...

# Control structures

```
if (i == 1){  
}
```

```
for (i in 1:N) {  
}
```

```
while (i<N){  
}
```

# Control structures

```
if (<something we want to test>){  
    <some instructions>  
} else {  
    <some instructions>  
}
```

Logical expression  
that gives **TRUE**  
or **FALSE**

Piece of code  
executed only when  
test result gives  
**TRUE**

Piece of code  
executed only when  
test result gives  
**FALSE**

# Control structures

```
if (i > 0){  
}
```

Can be applied to an object in a single line of code with the function **ifelse()**:

```
x <- c(-5, 8, -3)  
ifelse(x > 0, TRUE, FALSE)
```

Result:

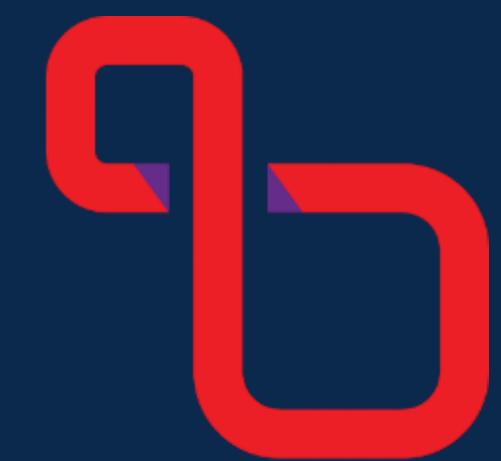

```
[1] FALSE  TRUE FALSE
```

Let's move on to coding...
